Project Description

Motivation:

- Temporal interference stimulation (TIS) is a non-invasive form of deep brain stimulation
- Deep brain stimulation can be used to help treat things like tremors and addiction
- Current products are expensive and bulky,

Opportunity:

- Create a low cost portable TIS device for Dr. Joshua Brown's neuroscience research at the University of Indiana

Requirements:

- Channel output should be an AC current source
- Maximum output from channels should be 30V and 5mA
- Frequency should be adjustable 0.5 kHz -> 30 kHz
- Current should ramp up and ramp
